

Getting started

You can use this template in both Pazly Pro and in your favorite code editor. There are very simple steps to getting started with both of these. It is advised you use a laptop or desktop computer, or a tablet with a high screen resolution.

Using the template in Pazly

6 easy steps to do this quickly and stressless. This template is compatible only with the **pro** version of Pazly. It is highly recommended to use the **pro** version where you have premium components to combine with this template.

1. First, go to pazly.dev
2. Make a **pro** account or login if you already have one. It is recommended to use the pro version where you have premium components to combine with this template.
3. Click on the 'Open HTML' button in the Pazly editor.
4. On your computer, in your unzipped template, go to 'for pazly developers' folder and look for the 'index.html' file. Drag and drop this file in the Pazly editor drop zone.
5. Once the file is validated, Pazly will confirm that it is compatible with Pazly. Click on the "Open HTML file" button

Pazly will display the template in the middle (preview) area of the editor. The template will be sliced in components. You can edit the components by selecting each one of them and customizing the text, colors and images using the editing tools on the right hand side of your screen

Using the template in a code editor

This requires you to be familiar with HTML, CSS and a bit of Javascript. Pazly uses Tailwind CSS version 1.x for its styling. Here is a [link to their documentation](#)

So, here is how to get started:

1. Unzip the template archive.
2. Open your favorite code editor
3. In your code editor, go to File, then Open
4. Select the 'for developer' folder from the unzipped template
5. Open the 'index.html' and start making changes
6. Some code editors have a built in live server. Look for the 'go live' or similar functions. If your code editor does not offer you this option, it is advised you install a live server plugin for your code editor.

Thank you for downloading this template and for using Pazly!
